

Project Overview

Executive Summary

This project is an intelligent research paper management platform that uses AI to make the peer-review process easier and faster. Instead of manually filling forms and searching through lists, the system understands what papers are about and automatically handles repetitive tasks.

When researchers upload their papers, AI extracts important information like the title, authors, and abstract. When admins need to find reviewers, AI suggests the best matches based on expertise. When reviewers evaluate papers, they get helpful summaries and quality checks.

Who Uses the System?

The Researcher (Author)

What they do:

- Upload their research paper as a PDF
- Review and confirm the information AI extracted
- Submit the paper for review
- Track their submission status

How AI helps:

- Automatically reads the PDF and fills in title, abstract, and authors
- Checks if anything is missing (like references or required sections)

The Admin (Conference Organizer)

What they do:

- Review submitted papers
- Assign reviewers to papers
- View statistics

How AI helps:

- Suggests the 5 best reviewers for each paper based on their expertise

The Reviewer

What they do:

- Review papers assigned to them
- Provide feedback and decide (accept, reject, or request changes)
- Submit their evaluation

How AI helps:

- Provides a quick summary of the paper (main points in 2-3 paragraphs)
- Checks for plagiarism and AI-generated content
